

NextGen E-Shop — Automated Testing Framework

Project Overview:

NextGen E-Shop is a project focused on developing an automated testing framework for e-commerce websites. The framework validates essential user journeys such as user login, product search, adding items to the cart, and later completing checkout.

Objectives:

- Ensure that critical e-commerce flows work reliably.
- Provide reusable test scripts organized using the Page Object Model (POM).
- Support external data (JSON/CSV) for test inputs and validation.
- Generate pass/fail test logs and HTML reports.

Scope:

- Implement test scripts for Login, Search, and Add to Cart.
- Build Page Object Model classes for main pages.
- Store user credentials and product data externally.
- Validate results using assertions.
- Push all code and documentation to GitHub for collaboration.

Expected Outcomes:

The team will deliver a working repository containing automated scripts that can run locally or on CI, producing clear reports for the three main flows. This sets the foundation for extending the framework to checkout and advanced features in later phases.
